Isimpondo

- isiMpondo (≈Mpondo, ≈Pondo) is dialect from southeastern South Africa in the Nguni group
- Folk perceptions: a “deep” variety of Xhosa, and/or a lect intermediate between Xhosa and Zulu
 - Differs in numerous minor morphological ways from standard Xhosa (<Gcaleka/Rharhabe)
 - Where Mpondo differs from Xhosa, it often follows Zulu
- Scholarly literature is fragmentary

Ndrondroza

- One feature of isiMpondo is so-called 'ndrondroza'
- In place of Xhosa [nd], [nt], Mpondo has prenasal stops with trilled release: <ndr>, <ntr>

	nt(r)	nd(r)
Xhosa	<i>intonga</i> 'stick'	<i>indonga</i> 'wall'
Mpondo	<i>intronga</i> 'stick'	<i>indronga</i> 'wall'

Ndrondroza

- NT~NTR sound correspondence seems largely systematic; not lexeme-specific, e.g.
- Points of variability (or uncertainty?):
 - indoda → indroda ~ occasionally indrodra
Possibly an effect related to consonant harmony?
 - We would expect Mpondo ~ Mpondro, but the former seems more widespread. However, not all Mpondo speakers produce the trills.

Questions

- What are the basic acoustic properties?
- Is there a contrast for voicing?
- If there is, where/how is the distinction realized acoustically in the sequence?
- If a distinction is realized, how does it relate to how voicing contrasts are realized in Xhosa generally?

Map of today's talk

- Background on the language and its context
- Trilled stops in other languages
- Preliminary results: acoustic and EGG data

Mpond(r)o

Deeper into Mpondo

- Mpondo is one of a handful of common labels for dialectal groups below the standard language level; most are lumped under 'Xhosa'
- Bhaca, Hlubi, Mpondomise, Mpondo, Xesibe, Thembu, Fengu/Fingo, Mbo
- Probable etymological (and historical) affiliation between Mpondo, Mbo, Mpondomise
- Current impressions:
 - virtually all speakers are bidialectal with Std Xhosa
 - only older speakers more comfortable with Mpondo
 - not all amaMpondo speak isiMpondo

More about ndrondroza

- *ndrondroza* is an ideophone, typically used for the sound of a dying car's engine
 - trilling ~ regular cyclic oscillation
- Sociolinguistic situation: not a prestige feature
 - apparent connotations of disfluency, stuttering
 - some literature seems to predate this: Pahl 1980, Cantrell 1946, Wilkes 1979, Bachmann 1890, Nyamende 1994
 - Difficult to elicit

Questions arise

- The Ndrondroza alternation introduces trilled releases on coronal stops in prenasalized context
- Doesn't seem to have any deep phonological similarities to [r]; really not a CC cluster
- /nt/ and /nd/ both undergo this change, but the resulting surface forms are routinely distinguished: <ntr> ≠ <ndr>
- Does this result in a trill with contrastive voicing?
- What we have here looks like (a) a trill, but (b) an obstruent, and (c) supports a voicing contrast while (d) obscuring the release where that contrast is usually realized

Trills and voicing

Trills and voicing

- Crosslinguistic norm: trills are voiced, liquids
- Partial voicelessness during a trill not new
 - Finnish /r/ can have voicing interruption for one or more cycle (Ladefoged & Maddieson 1996)
 - Trills can also be devoiced, especially in clusters with voiceless obstruents
 - Neither of these is a **contrast** *per se*, though
- Stereotype: trilled [r] is normally a sonorant, is phonetically voiced (but not contrastively so)

Precedents

- Mangbetu (Demolin 1988, 1991, et seq)
 - 3-way contrast: voiced, voiceless, prenasal
 - for bilabials, and also retroflex coronals
- Ndebele (Ziervogel 1959?)
 - Some variety of SA Ndebele is reported to have trilled release of /nt/ and/or /nd/
- Nias (PNG) (Yoder 2010)
 - same inventory as Mangbetu, but further away

Our study

Variables

- Lect: Xhosa / Mpondo
- Voicing: T / D

Tokens

- 22 items (10 with $nd(r)$ and 12 with $nt(r)$)
- Read 4 times in standard Xhosa and 4 times in Mpondo
- 173 total tokens

Sample tokens

	nt(r)	nd(r)
Xhosa	<i>intonga</i> 'stick'	<i>indonga</i> 'wall'
Mpondo	<i>intronga</i> 'stick'	<i>indronga</i> 'wall'

Recording setup

- Glottal Enterprises EG2-PCX2 electroglottograph
 - Connected to laptop via GE USB adapter
- AKG C520 head-worn condenser cardioid microphone
 - Connected to laptop via Zoom H4N recorder (as USB interface)
- Both signals recorded simultaneously in Audacity as single stereo WAV file

Measures: Acoustic

- Closure duration
- Percent voicing in closure

Measures: EGG periodicity

- Harmonics-to-noise-ratio (HNR)
- Jitter
- Pulses per second
- Percent voicing

Analysis

- Linear mixed model in R, using *lme4*
- Minimal model with acoustic/EGG measure as dependent variable, fixed effect of segment*, random effect of word
- In cross-lect analysis, included fixed interaction term between segment and lect*
- p-values from *lmerTest* via Satterthwaite's method

Results

Closure

A baseline:
Xhosa nt/nd

Xhosa nt/nd: Acoustic

$\beta = -34.471$, $SE = 3.620$,
 $t(21.061) = -9.524$, $p < 0.001^{***}$

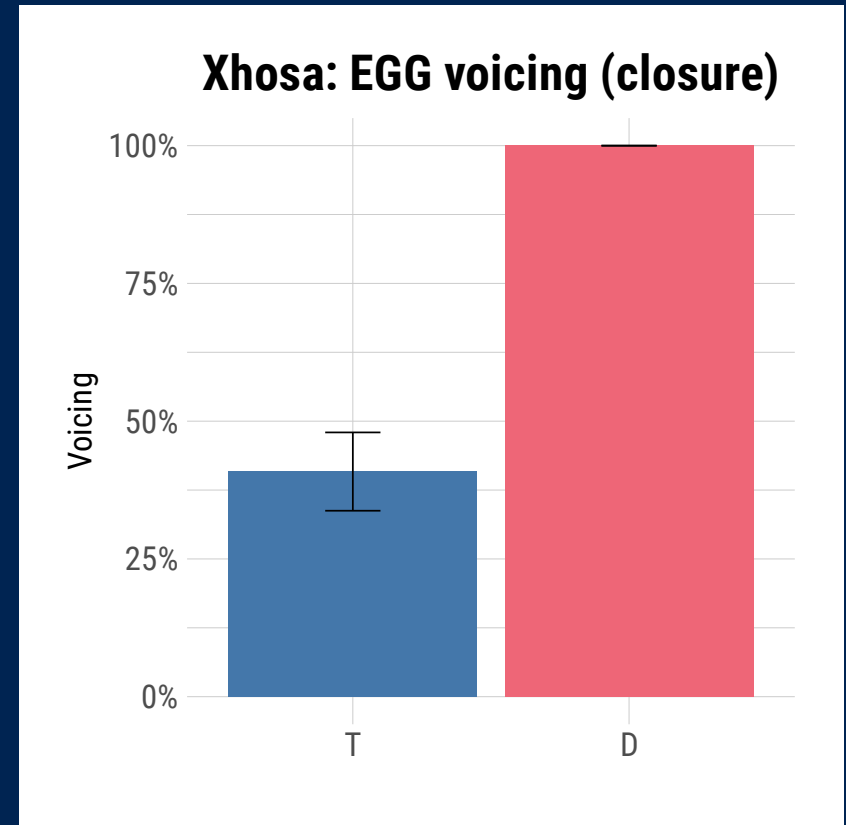

$\beta = 0.244$, $SE = 0.053$, $t(72)$
 $= 4.599$, $p < 0.001^{***}$

 $t(136.463) = -11.513$, $p < 0.001^{***}$

Lect

- Mpondo
- Xhosa

$\beta = 0.099$, $SE = 0.093$,
 $t(136.293) = 1.061$, $p = .291$

Across lects: EGG

$\beta = 16.339$, $SE = 12.063$,
 $t(135.0864) = 1.354$, $p = 0.179$

Lect

- Mpondo
- Xhosa

$\beta = 0.175$, $SE = 0.074$,
 $t(133.442) = 2.359$, $p < 0.05^*$

Across lects: EGG

$\beta = -28.93$, $SE = 2.513$,
 $t(136.463) = -11.513$, $p < 0.001^{***}$

Lect

- Mpondo
- Xhosa

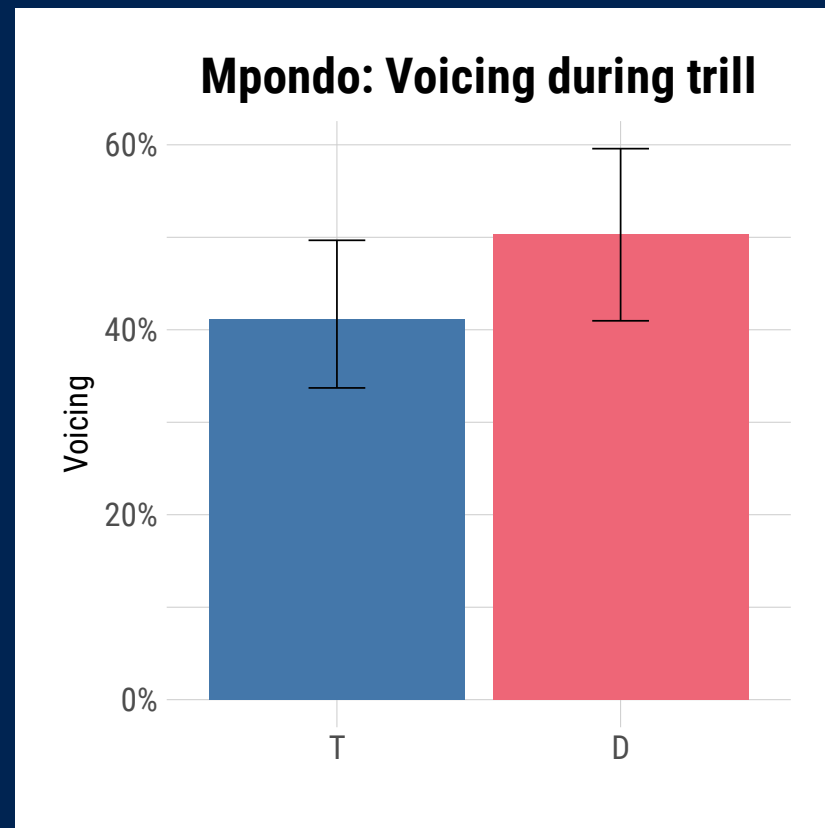

$\beta = 6.088$, $SE = 0.674$,
 $t(121.847) = 9.039$, $p < 0.001^{***}$

Trill portion (Mpondo only)

Trill portion: Acoustic

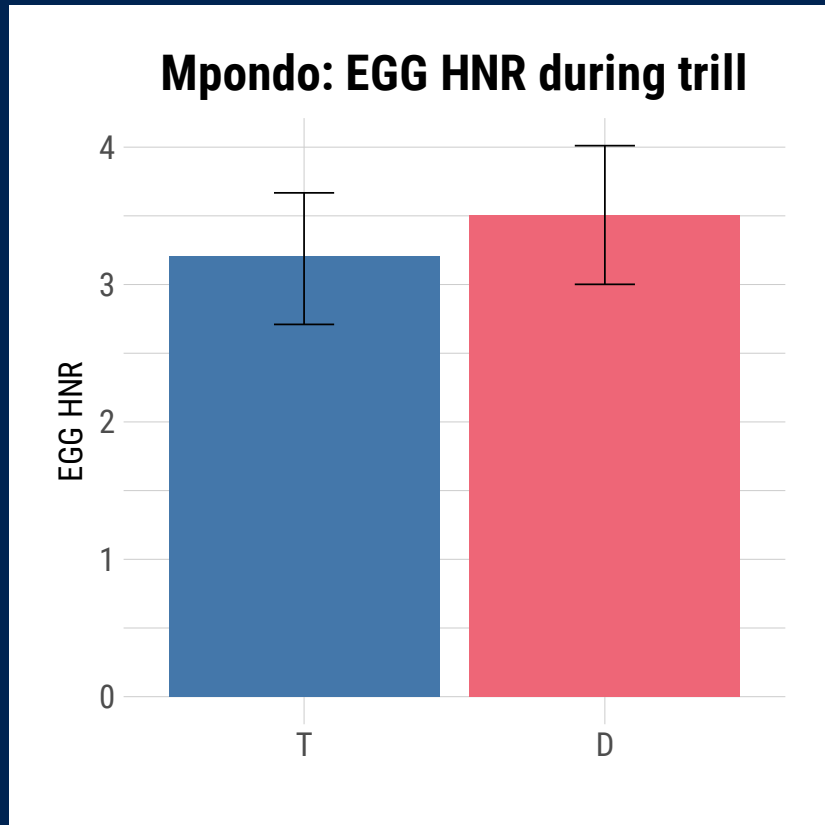

$\beta = -19.593$, $SE = 5.892$,
 $t(20.000) = -3.325$, $p < 0.005^{**}$

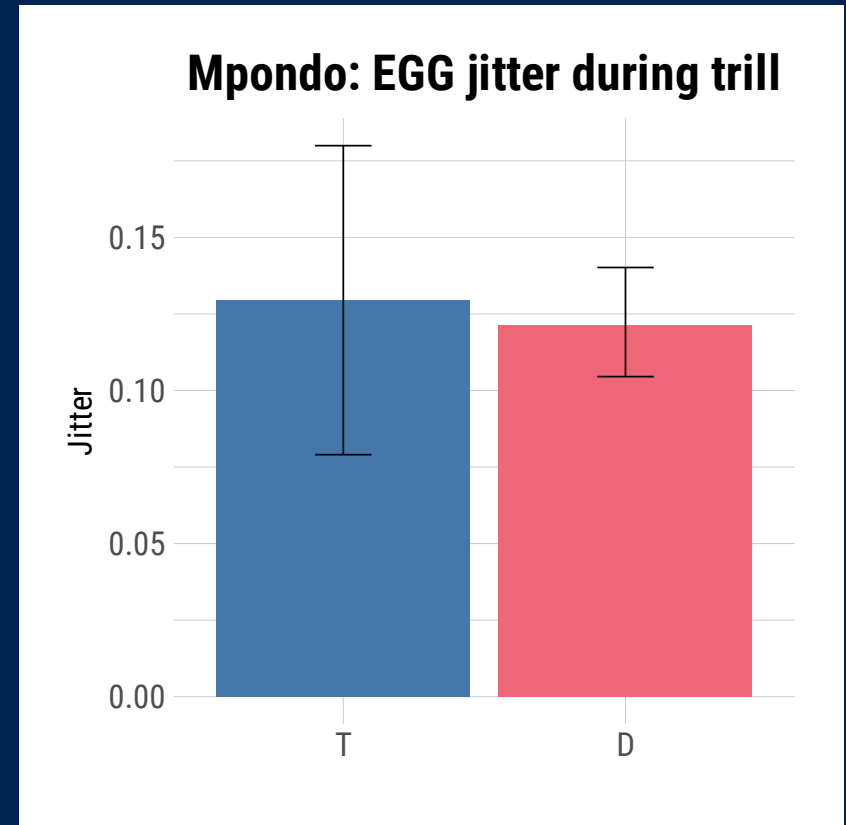

$\beta = 0.092$, $SE = 0.086$
 $t(20.000) = 1.072$, $p = 0.29$

Trill portion: EGG

$\beta = 0.297$, $SE = .390$
 $t(21.828) = 0.761$, $p = 0.455$

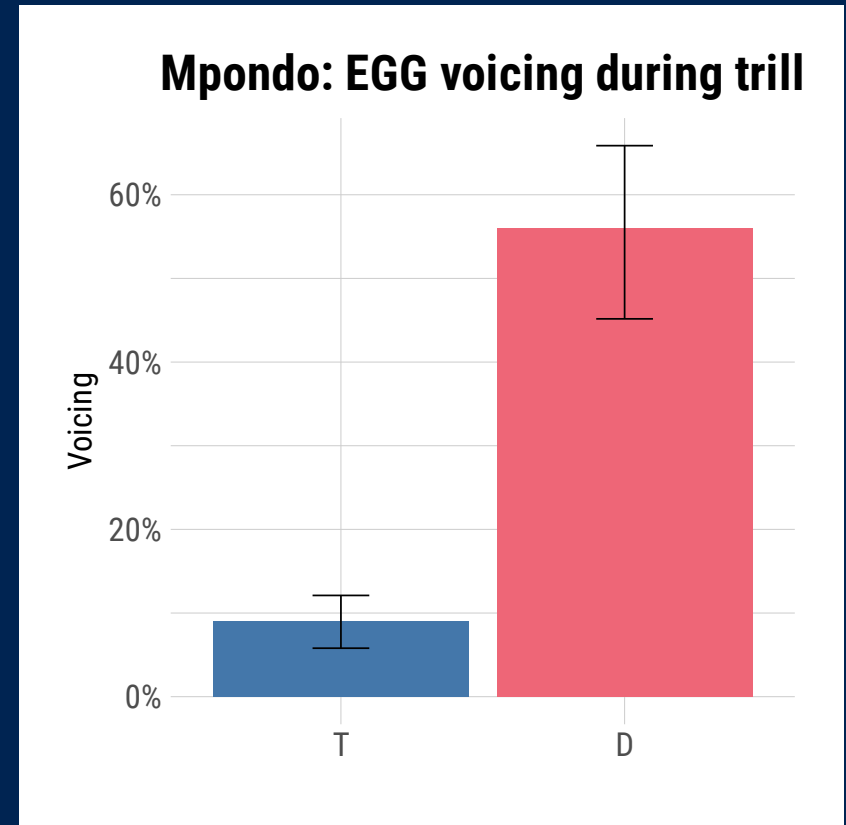

$\beta = -0.008$, $SE = 0.023$
 $t(30) = -0.352$, $p = 0.727$

Trill portion: EGG

$\beta = 47.357$, $SE = 8.042$,
 $t(86) = 5.889$, $p < 0.001^{***}$

$\beta = 0.468$, $SE = 0.060$,
 $t(20.000) = 7.864$, $p < 0.001^{***}$

Conclusions

- isiMpondo has an interesting pattern where historical (underlying?) /nt/ and /nd/ are produced with a trilled release
- We have examined acoustic and EGG data for these sounds, and compared them to Xhosa equivalents produced by the same speaker
- Preliminary results: [ntr] and [ndr] seem to be differentiable to speakers, and seem different acoustically (and articulatorily) - but the distinction is manifested differently than is typical for Xhosa nt/nd
- Further study needed to understand where and how the phonetics are distinct; future work to look at following V
